Analysis Report: Form Submission Activity (May 2026)

This report provides a comprehensive analysis of the form submission data recorded between May 3, 2026, and May 15, 2026. The dataset consists of 7 total entries originating from a single form template.

Main Themes and Topics

The primary theme of this dataset is repetitive administrative data entry within a controlled environment. All submissions are categorized under the "dynamic" type and are linked to a single form ID (6a07112fb8109790606361a0). The activity is concentrated among a very small pool of contributors, suggesting a specialized task or a testing phase for form deployment.

Key Findings

The data reveals a high level of concentration regarding participation. Only two unique workers were responsible for all recorded activity during this period.

Worker Activity Comparison

Worker Name	Worker ID	Submissions	% of Total
2310080019	6a07112eb810979060636150	4	57.1%
sindhu.j1729	6a07112fb810979060636156	3	42.9%
Total	-	7	100%

Notable Patterns

The most significant pattern identified is the temporal synchronization of the submissions. Every single entry, regardless of the date or worker, was recorded at exactly 13:27:29 UTC, varying only by milliseconds.

1. Daily Distribution: Submissions occurred on May 3, 7, 8, 11, and 15.
2. Batching: Multiple entries were often submitted on the same day (e.g., May 8 and May 15) at nearly the identical second.
3. Consistency: The "dynamic" type and "formId" remain constant across all records, indicating no variation in the task structure.

Data Quality Assessment

The data quality is considered low to suspicious for organic human activity. The primary concern is the identical timestamp (13:27:29) across all seven submissions over a 12-day period. This suggests that the data was likely generated by an automated script, a batch upload process, or a system clock error.

While the records are structurally sound and contain no null values, the lack of temporal variance indicates these are not unique, real-time human interactions. Further investigation is recommended to determine if these entries represent synthetic test data rather than genuine field submissions.
